Hello, TJ —
Thank you so much for your patience, as we go through this process.
I learned that Phil would like you to complete the questionnaire below. Please let us know if you have any questions.

The instructions are:

1. Write a golang kafka publisher that takes a csv file and publishes each line as a message to a topic with 4 partitions
2. Write a goland kafka consumer that using a consumer group to read off the topic for any message that calculates the sum of all number and output the sum, read off the topic for any messages with English words and sorts the words alphabetically and outputs

They would like a follow demo to walk through the below.
* High level design document of the "application" and how it follows a restful design pattern
  * Using go lint, go vet, go test for testing the application
  * Demo of the application taking the provided csf file

Would Monday be reasonable to send a response back to me by?
Thank you.
